

**The result of Grigori Grabovoi.
Testimony of Ruslanov Vadim
Restoring the health of the father
from lung metastases.**

I, Ruslanov Vadim Vadimovich, I am the son of Ruslanov Vadim Lvovich.

Ruslanov Vadim Lvovich had X-Ray pictures taken on his lungs at the computer tomography room, at the

clinic "Medicine".

Those pictures showed that Ruslanov Vadim Lvovich had metastases in his right lung - which was documented by the protocol dated 7 May 1996, signed by the doctor.

Additionally, there are 3 snapshots of computer tomography attached to this protocol, stating that there are several foci of metastasis in the right lung (showing X-Rays).

Here is the first shot. Here is the second shot, here is the name- Ruslanov. And now there will be a third shot, which also belongs to Ruslanov. And these three pictures, I repeat, were taken on May 7, 1996.

And after that Vadim Lvovich got back to the Institute of Diagnostics and Surgery, where, on May 23, 1996, he had another X-Ray of the right and left lungs done. And this picture confirms that he really had metastases in his right lung. Here: 1, here: 2 and here: 3 (indicating in the picture), it is visible here: one, two, three - on May 23, 1996.

After that, Grigori Petrovich Grabovoi had visited us on June 1, 1996 and held a session for 30 minutes, after that he had asked to take X-Rays again. These pictures, unfortunately, were taken only on June 11, 1996. Here are pictures of the lungs, which belong to Ruslanov Vadim Lvovich (showing X-Rays).

After that, 11 days passed, they should have been done much earlier, but it did not work out. And on this lung one can see that the metastases are absent, that the lungs in those places are completely clean. I repeat, this was done on June 11, 1996. Here is an X-Ray of the right lung, here you can see that there are no metastases, the lung is clean.
