

**The result of Grigori Grabovoi.
Testimony of
Antonina Serebryannikova
Significant improvement
in well-being.
Diagnosis: pulmonary
tuberculosis.**

I, Antonina Vladimirovna, Serebryannikova, physio-therapist. For 37 years have worked with the tuberculosis patients. I have occupational disease - pulmonary tuberculosis, intolerance to drugs.

Intolerance to drugs and allergies made me to appeal to Grigori Petrovich, because, due to above reasons, I have no results to the medical treatments.

I arrived in a severe condition, ESR-40. In my lungs, radiographically there were irregularly shaped cavities with the inflammatory, infiltrative shaft around; foci of infiltration and dissemination throughout the lung.

After a single session, there are significant positive dynamics, both clinical and radiological.

Radiographically, the cavity has ceased to be bloated, collapses, infiltration has significantly resolved, there is a tendency to fibrosis, which, in general, has existed before.

But now the inflammatory elements are disappearing.

The attacks of breathlessness, have stopped. The amount of sputum in the mornings and due to coughing has decreased. Previously, I was bothered by coughing and choking attacks several times a day. Now there are practically no attacks, and overall health has improved significantly. I have no weakness in the body, good appetite. General condition is quite satisfactory and apparently corresponds to the dynamics of the process in the lungs.
